Definition of local ring

Call a ring R local if R has exactly one maximal ideal.

Examples of local rings

- (1) \mathbb{Z}_4 .
- (2) \mathbb{Z}_9 .
- (3) \mathbb{Z}_{p^2} , where p is a prime number.
- (4) $\frac{\mathbb{Z}_p[X]}{(X^2)}$, where p is a prime number.

Introduction

A Refinement
of Cayley
Graphs
Associated to
Rings

(1)

Let R be a finite commutative ring. Then

$$R = R_1 \times R_2 \times \cdots \times R_k,$$

where R_i is a local ring.

(2)

Let R be a finite commutative ring. Then

$$R/J(R) = F_1 \times F_2 \times \cdots \times F_k,$$

where F_i is a Field.

(Here $J(R)$, the Jacobson radical of R , is the intersection of all maximal ideals of R)

Structure of Jacobson radical

$$J(R) = \{r \in R \mid 1 + rx \text{ is unit for all } x \in R\}.$$

Theorem

u is a unit in R if and only if $u + J(R)$ is a unit in $R/J(R)$.

Some important graphs associated to rings

- (1) Zero divisor Graph of a ring.
- (2) Cayley Graph of a ring.
- (3) Unit Graph of a ring.

(1) Zero divisor graph of a ring

The concept of a zero-divisor graph of a commutative ring was first introduced by Beck. (In his work all elements of the ring were vertices of the graph).

$V(\Gamma(R) = Z(R) \setminus \{0\}$ and two distinct vertices x and y are adjacent if and only if $xy = 0$.

[Beck] I. Beck, Coloring of commutative rings, J. Algebra 116 (1988), 208-226.

$$\mathbb{Z}_2 \times \mathbb{Z}_7$$

$$\mathbb{Z}_3 \times \mathbb{Z}_5$$

(2) Cayley graph of a ring

The *Cayley graph* $\Gamma(R)$ is the graph with vertex set R such that two distinct vertices x and y are adjacent if and only if $x - y$ is unit in R . Unitary Cayley graphs are introduced in:

Lucchini, et al.

A. Lucchini, A. Maroti, Some results and questions related to the generating graph of a finite group, Proceedings of the Ischia Group Theory Conference, 2008.

Definition in this talk

A Refinement of Cayley Graphs Associated to Rings

Let R be a finite ring and $U(R)$ be the set of all unit elements of R . The Unit graph $\Gamma(R)$ is the graph with vertex set R such that two distinct vertices x and y are adjacent if and only if there exists a unit element u of R such that $x + uy$ is unit in R .

If we omit the word "distinct", we obtain the graph $\Gamma_\ell(R)$; this graph may have loops.

Motivation

- (1) The study of algebraic structures using the properties of graphs,
- (2) Some result about unit 1-stable range rings.

We recall that a ring R is said to have unit 1-stable range if, whenever $Rx + Ry = R$, there exists $u \in U(R)$ such that $x + uy \in U(R)$.

Some examples

When $\Gamma(R)$ is a Complete Bipartite Graph

Let R be a ring and let M be a maximal ideal of R such that $|R/M| = 2$. Then $\Gamma(R)$ is a complete bipartite graph if and only if R is a local ring.

Degree of Vertices

Let R be a local ring with maximal ideal M such that $|R/M| > 2$ and let $x \in R$. Then

$$\deg(x) = \begin{cases} |R| - 1 & \text{if } x \in U(R), \\ |U(R)| & \text{otherwise.} \end{cases}$$

Graphs
Associated to
Rings

Connectedness (1)

$\Gamma(R)$ is connected if and only if $R/J(R)$ has at most one \mathbb{Z}_2 as a summand.

Connectedness (2)

$\Gamma(R)$ is not connected if and only if
 $R = \mathbb{Z}_2 \times \mathbb{Z}_2 \times R_3 \times \cdots \times R_n$. (R_i is a local ring)

Clique and Chromatic number

Let $R = R_1 \times R_2 \times \cdots \times R_n$ be a ring, where R_i is a local ring with maximal ideal M_i . Then

$$\chi(\Gamma(R)) = \omega(\Gamma(R)) = \begin{cases} 2 & \text{if } |R_i/M_i| = 2 \text{ for some } i \\ |U(R)| + n & \text{otherwise.} \end{cases}$$

Proof

Let $|R_i/M_i| = 2$, for some $1 \leq i \leq n$. Then

$M := R_1 \times \cdots \times R_{i-1} \times M_i \times R_{i+1} \times \cdots \times R_n$ is a maximal ideal of R such that $|R/M| = 2$. Therefore $\omega(\Gamma(R)) = 2$.

Now suppose that $|R_i/M_i| > 2$ for all $1 \leq i \leq n$. We set:

$$\begin{aligned} S_i &:= U(R_1) \times \cdots \times U(R_{i-1}) \times M_i \times R_{i+1} \times \cdots \times R_n. \\ S_{n+1} &:= U(R_1) \times U(R_2) \times \cdots \times U(R_n). \end{aligned}$$

Introduction

A Refinement
of Cayley
Graphs
Associated to
Rings

Proof

It is easy to see that $S_i \cap S_j = \emptyset$, for all $i \neq j$, and $\bigcup_{i=1}^{n+1} S_i = R$. S_{n+1} is a clique. Set

$$C := S_{n+1} \cup \{(0, 1, 1, \dots, 1), (1, 0, 1, \dots, 1), (1, 1, \dots, 1, 0)\}.$$

It is easy to see that C is a clique of $\Gamma(R)$. Since S_i ($1 \leq i \leq n$) is a coclique, then every arbitrary clique of $\Gamma(R)$ contains at most one element of S_i ($1 \leq i \leq n$). Therefore $\omega(\Gamma(R)) = |U(R_1)| \times |U(R_2)| \times \dots \times |U(R_n)| + n = |U(R)| + n$. This argument also shows that $\chi(\Gamma(R)) = |U(R_1)| \times |U(R_2)| \times \dots \times |U(R_n)| + n = |U(R)| + n$.

Planarity for $\Gamma(R)$

$\Gamma(R)$ is planar if and only if R is one of the following rings

(1) $\underbrace{\mathbb{Z}_2 \times \mathbb{Z}_2 \times \cdots \times \mathbb{Z}_2}_{n \text{ times}}$.

(2) $\underbrace{\mathbb{Z}_2 \times \mathbb{Z}_2 \times \cdots \times \mathbb{Z}_2}_{n \text{ times}} \times \mathbb{Z}_4$.

(3) $\underbrace{\mathbb{Z}_2 \times \mathbb{Z}_2 \times \cdots \times \mathbb{Z}_2}_{n \text{ times}} \times \mathbb{F}_4$.

(4) $\underbrace{\mathbb{Z}_2 \times \mathbb{Z}_2 \times \cdots \times \mathbb{Z}_2}_{n \text{ times}} \times \frac{\mathbb{Z}_2[x]}{(x^2)}$.

Some Properties of $\overline{\Gamma}(R)$

Connectedness

Let $R = R_1 \times R_2 \times \cdots \times R_n$ be a ring, where R_i is a local ring with maximal ideal M_i . Then $\overline{\Gamma}(R)$ is connected if and only if R satisfies one of the following:

- (1) $|R_1/M_1| = |R_2/M_2| = 2$ and $n \geq 2$.
- (2) $|R_1/M_1| = 2$ and $|R_k/M_k| > 2$ for every $2 \leq k \leq n$.

Hamiltonian Cycle

Let $R = R_1 \times R_2 \times \cdots \times R_n$ be a ring, where R_i is a local ring with maximal ideal M_i . Then $\overline{\Gamma}(R)$ is Hamiltonian if and only if R satisfies any one of the following three cases:

- (1) $|R_1/M_1| = |R_2/M_2| = 2$ and $n \geq 2$.
- (2) $n = 2$ with $|R_1/M_1| = 2$, $|R_2/M_2| > 2$ and at least one of R_1 or R_2 is not field.
- (3) $n \geq 3$, $|R_2/M_2| = 2$ and $|R_k/M_k| > 2$ for every $2 \leq k \leq n$.
