The Problem

General setting: transportation network design & use.
At least two decision makers u ("upper") and ℓ ("lower").

- 1 Decision maker u (the network designer) makes decisions x_u on investment & maintenance costs, pricing, etc.
- 2 Decision maker(s) ℓ (network users) make network usage decisions x_ℓ . (For simplicity, here only one lower-level decision maker. Can be generalized to the general case.)

Decision maker u tries to minimize its cost function $f_u(x_u, x_\ell)$;
decision maker ℓ tries to minimize its own cost function $f_\ell(x_u, x_\ell)$.

Decision variables are

upper-level decision vector $x_u \in \mathbb{R}^{n_u}$,

lower-level decision vector $x_\ell \in \mathbb{R}^{n_\ell}$.

The Problem & Notation

For a *fixed* $x_U \in \mathbb{R}^{n_U}$, consider the parameterized *lower level problem*

$$\begin{aligned} \min_{x_\ell} \quad & f_\ell(x_U, x_\ell) \\ \text{subject to} \quad & g_\ell(x_U, x_\ell) \leq 0. \end{aligned} \quad (P(x_U))$$

The *bilevel optimization problem* is now

$$\begin{aligned} \min_{x_U, x_\ell} \quad & f_U(x_U, x_\ell) \\ \text{subject to} \quad & g_U(x_U, x_\ell) \leq 0, \\ & x_\ell \text{ solves } P(x_U). \end{aligned} \quad (1)$$

(Optimistic formulation.)

Note: upper level constraints g_U can also depend on x_ℓ .

Optimizing over Abstract Sets

Let $C \subseteq \mathbb{R}^n$ be closed and $f \in \mathbf{C}^1(\mathbb{R}^n, \mathbb{R})$. Consider the problem

$$\begin{array}{ll} \min_x & f(x) \\ \text{subject to} & x \in C. \end{array} \quad (P)$$

Let $\|\cdot\|$ be the euclidean norm. For arbitrary $y \in \mathbb{R}^n$, denote by $\text{proj}_C(y)$ the *projection of y onto C* , i. e.

$$\text{proj}_C(y) := \arg \min_z \{\|y - z\| \mid z \in C\}.$$

Then, the first-order optimality condition for (P) holds if and only if

$$x \in \text{proj}_C(x - \nabla f(x)).$$

(See Eaves 1971, Harker & Pang 1990, Sun 1996, Fl. & V. 2004.)

Optimizing over Abstract Sets

Idea:

Solve

$$\text{proj}_C(x - \nabla f(x)) = x$$

instead of

$$\begin{aligned} \min_x \quad & f(x) \\ \text{subject to} \quad & x \in C. \end{aligned} \tag{P}$$

Disadvantage: reformulation is nonsmooth.

Advantage: only knowledge of proj_C is assumed, and not of C .
(Especially, no explicit knowledge of functions g_i, h_j with $C = \{x \mid g_i(x) \leq 0, h_j(x) = 0 \forall i \forall j\}$ required.)

Advantage: can easily be generalized if lower-level problem is equilibrium problem.

Optimizing over Abstract Sets

Situations where proj_C might be easier to handle than explicit constraint functions:

- 1 Information of C resides in a distributed computing environment: proj_C easy to compute, but Lagrangian hard to assemble. (Fl. 2006, 2010)
- 2 C a particular cone:
 - 3 C convex with "nice" dual C° (use Moreau: $x = \text{proj}_C(x) + \text{proj}_{C^\circ}(x)$): C isotone cone or simplicial cone, known only by extreme rays. (Nemeth et al '10, Ekart et al '10)
 - 4 C copositive cone? (Sponsel 2011)
- 3 $C \subset \mathbb{R}^n$ polyhedron with m faces, $n \ll m$. (Llanas et al '00)
- 4 C complement of open polyhedron. (Mangasarian '00)
- 5 C set of correlation matrices. (Higham 2002)
- 6 $C = \{Y \in \mathbb{R}^{m \times m} \mid Y = Y^T, Y_{i,i} = 1 \forall i\}$. (Qi & Sun, 2006)

Optimizing over Abstract Sets

Reformulation of the lower level problem I

Use the reformulation on the lower level problem:

$$n = n_\ell,$$

$$x = x_\ell,$$

$$f = f_\ell(x_U, \cdot),$$

$$C = C(x_U) := \{z \in \mathbb{R}^{n_\ell} \mid g_\ell(x_U, z) \leq 0\}$$

and define the nonsmooth function

$$P(x_U, x_\ell) := \text{proj}_{C(x_U)}(x_\ell - \nabla_{x_\ell} f_\ell(x_U, x_\ell)) - x_\ell.$$

A reformulation of the bilevel problem is then

$$\begin{aligned} & \min_{x_U, x_\ell} && f_U(x_U, x_\ell) \\ & \text{subject to} && g_U(x_U, x_\ell) \leq 0, \\ & && P(x_U, x_\ell) = 0. \end{aligned}$$

Smoothness of Reformulation I

How smooth is $P(x_u, x_\ell) = \text{proj}_{C(x_u)}(x_\ell - \nabla_{x_\ell} f_\ell(x_u, x_\ell)) - x_\ell$?
I.e. let f_ℓ be sufficiently smooth. How smooth is $\text{proj}_{C(x_u)}(\dots)$
w.r.t. (x_u, x_ℓ) ?

Three easy special cases for fixed x_u :

- $\text{proj}_{C(x_u)}(\cdot) = \text{id}$ within $\text{int}(C(x_u))$.
- $y \in \text{bd}(C(x_u))$; direction $d \in \mathbb{R}^{n_\ell}$ given:

$$(\text{proj}_{C(x_u)})'_+(y; d) = \text{proj}_{T(x_u, y)}(d),$$

where $T(x_u, y)$ is the tangent cone of $C(x_u)$ at y
(Zarantonello 1971).

- Let $C(x_u)$ have a \mathbf{C}^2 -boundary. Then,
 $\text{proj}_{C(x_u)}(\cdot) \in \mathbf{C}^1(\mathbb{R}^{n_\ell} \setminus C(x_u))$, and explicit representations
of the derivative exist (Holmes 1973).

Smoothness of Reformulation I

How smooth is $P(x_u, x_\ell) = \text{proj}_{C(x_u)}(x_\ell - \nabla_{x_\ell} f_\ell(x_u, x_\ell)) - x_\ell$?
I.e. let f_ℓ be sufficiently smooth. How smooth is $\text{proj}_{C(x_u)}(\dots)$
w.r.t. (x_u, x_ℓ) ?

Three easy special cases for fixed x_u :

- $\text{proj}_{C(x_u)}(\cdot) = \text{id}$ within $\text{int}(C(x_u))$.
- $y \in \text{bd}(C(x_u))$; direction $d \in \mathbb{R}^{n_\ell}$ given:

$$(\text{proj}_{C(x_u)})'_+(y; d) = \text{proj}_{T(x_u, y)}(d),$$

where $T(x_u, y)$ is the tangent cone of $C(x_u)$ at y (Zarantonello 1971).

- Let $C(x_u)$ have a \mathbf{C}^2 -boundary. Then, $\text{proj}_{C(x_u)}(\cdot) \in \mathbf{C}^1(\mathbb{R}^{n_\ell} \setminus C(x_u))$, and explicit representations of the derivative exist (Holmes 1973).

Smoothness of Reformulation I

How smooth is $P(x_u, x_\ell) = \text{proj}_{C(x_u)}(x_\ell - \nabla_{x_\ell} f_\ell(x_u, x_\ell)) - x_\ell$?
I.e. let f_ℓ be sufficiently smooth. How smooth is $\text{proj}_{C(x_u)}(\dots)$
w.r.t. (x_u, x_ℓ) ?

Three easy special cases for fixed x_u :

- $\text{proj}_{C(x_u)}(\cdot) = \text{id}$ within $\text{int}(C(x_u))$.
- $y \in \text{bd}(C(x_u))$; direction $d \in \mathbb{R}^{n_\ell}$ given:

where $T(x_u, y)$ is the tangent cone of $C(x_u)$ at y
(Zarantonello 1971).

- Let $C(x_u)$ have a \mathbf{C}^2 -boundary. Then,
 $\text{proj}_{C(x_u)}(\cdot) \in \mathbf{C}^1(\mathbb{R}^{n_\ell} \setminus C(x_u))$, and explicit representations
of the derivative exist (Holmes 1973).

Smoothness of Reformulation I

Theorem (Directional Differentiability) *Assume the following:*

- 1 $f_\ell \in \mathbf{C}^2(\mathbb{R}^{n_u} \times \mathbb{R}^{n_\ell}, \mathbb{R})$. and $g_\ell \in \mathbf{C}^2(\mathbb{R}^{n_u} \times \mathbb{R}^{n_\ell}, \mathbb{R}^{m_\ell})$.
- 2 For each $x_u \in \mathbb{R}^{n_u}$, $g_{\ell,i}(x_u, \cdot)$ is convex.
- 3 Slater's condition for each lower level problem: for each $x_u \in \mathbb{R}^{n_u}$, there exists a $z \in \mathbb{R}^{n_\ell}$ with $g_{\ell,i}(x_u, z) < 0$ for all i .
- 4 There exists a constant $\alpha > 0$, such that, for all (x_u, x_ℓ) :

$$\|(\nabla_y g_\ell(x_u, y(x_u, x_\ell)))_{[i: g_{\ell,i}(x_u, P(x_u, x_\ell)) - x_\ell = 0]} v\| \geq \alpha \|v\|$$

for all $v \in \mathbb{R}^{\{i: g_{\ell,i}(x_u, P(x_u, x_\ell)) - x_\ell = 0\}}$.

Then, P is directionally differentiable at (x_u, x_ℓ) in an arbitrary direction $d \in \mathbb{R}^{n_u} \times \mathbb{R}^{n_\ell}$ and the forward and backward directional differentials can be computed by solving some explicitly known QPs.

Smoothness of Reformulation I

Theorem (Gateaux Differentiability) *Let the same assumptions as in the last theorem hold and let the function g_ℓ not depend on x_u . Then, the function P is Gateaux differentiable if and only if strict complementarity holds:*

$$\{i : g_{\ell,i}(P(x_u, x_\ell) - x_\ell) = 0\} = \{j : \lambda_j(x_u, x_\ell) > 0\},$$

where $\lambda_j(x_u, x_\ell)$ are the Lagrangians of the projection problem

$$\begin{aligned} \min_y \quad & \|y - x_\ell + \nabla_{x_\ell} f_\ell(x_u, x_\ell)\| \\ \text{subject to} \quad & g_\ell(y) \leq 0. \end{aligned}$$

Again, differentials can be computed by solving some explicitly known QPs.

Exact Penalties for Reformulation

Theorem Let $\nabla_{x_\ell} f_\ell$ be piecewise analytic; let f_u be Lipschitz continuous. Let $C : x_u \mapsto C(x_u)$ be continuous and convex for all x_u and let the mapping have the following property: for each $x_u \in \mathbb{R}^{n_u}$ and for each $y \in \text{bd}(C(x_u))$ let there be a neighbourhood U of y such that there exists finitely many analytic and strongly convex functions $g_i(x_u, \cdot)$ such that

$$C(x_u) \cap U = \{x_\ell \mid g_i(x_u, x_\ell) \leq 0 \forall i\}.$$

Let $\{(x_u, x_\ell) \mid g_u(x_u, x_\ell) \leq 0\}$ be compact and subanalytic. Then, there exists a constant $\beta^* > 0$ such that for all $\beta \geq \beta^*$ we have that

$$\|P(x_u, x_\ell)\|_1^{1/\beta}$$

is an exact penalty function for the reformulated problem.

Current Section

- 1 Problem Statement
- 2 A Slight Detour: Optimizing over Abstract Sets
- 3 Application to Bilevel Optimization
- 4 Theoretical Results
- 5 Numerical Results**
- 6 Lessons Learnt & Future Plans

Very preliminary results.

- 1 Purpose: sanity check. Does the reformulation make sense at all?
- 2 *Lazy* approach: reformulated problem solved with SLP/SQP code with ℓ_1 -penalty for constraints and nonsmooth step length algorithm. (Previously implemented for ESA, European Space Agency.)
- 3 Differentials approximated by finite differences.

Numerical Results

Random bilinear problems with $n_u = n_\ell = 10$, $m_u = 1$, $m_\ell = 2$, feasibility & optimality tolerance $1e-6$:

prob.	1	2	3	4	5	6	7	8	9	10
SLP iter	65	25	17	19	27	60	117	234	97	7
SQP iter	10f	43	6f	4f	11	15	5f	12	14	5

- All problems solved to specified accuracy by SLP.
- Central differences perform better than forward differences. (In contrary to theory?!)
- SQP performance sensitive to upper and lower starting point: code can jam at an infeasible point, restoration phase then unsuccessful.

Numerical Results

Test problems from literature, reformulated problems solved with IPOPT, all other settings as before.

Lessons learnt & Future Plans

- Reformulation provides flexible framework for bilevel problems.
- Can be approached with a variety of algorithms. What is the best approach to solve the reformulated problem?
- No assumption on uniqueness of lower level solutions.
- Further tests necessary to ascertain performance of the approach.
- Generalization to multilevel problems possible.
- Generalization to multiobjective lower level problems?
